

## Specification Amendments

Please replace the paragraph at column 11 line 56 through column 12 line 5, with the following:

If different light outputs 14 and 15 are desired, a light bulb with high-beam and low-beam filaments could be used. However, according to the preferred embodiment shown in FIGS. 1, 2, 4 and 5, the flashlight has two separate lamps 12 and 13, one high power, the other low power, and both lamps are mounted in a single reflector 36, with the higher power lamp 12 mounted in a central opening in the reflector and having its filament 112 located at the focus of the reflector, and thus having its beam 14 focused by that reflector, and the lower power lamp 13 being mounted off to the side of the high power lamp 12 in a second opening in the reflector and thus out of focus in the reflector 36. In consequence, the low power lamp 13 does not use the reflector to focus its beam 15, but instead may use a lens 117 on the front of the transducer mount 17.

According to a preferred embodiment of this aspect of the invention, there is a refractive lens 213 for the second or low power lamp 13, which may be directly on that lamp for focusing its beam. As shown in FIGs. 1 and 2, the lower power lamp 13 is oriented for generating its light beam 15 along a generally similar direction as the light beam 14 of the higher power lamp 12. For example, as shown in FIGs. 1 and 2, the higher and lower power lamps 12 and 13 may be oriented substantially parallel to one another, pointing in substantially the same direction. As further shown in FIGs. 1 and 2, the lower power lamp 13 is recessed in its reflector opening with its refractive lens 213 exposed in the reflector 36, preferably with its refractive lens 213 adjacent to the reflector 36 at the reflector opening in which the lower power lamp 13 is recessed.
